

Complete current baseline atlas (large-lineage reruns pending for sepsis, AF/flutter, and heart failure)

A Transition: all six methods

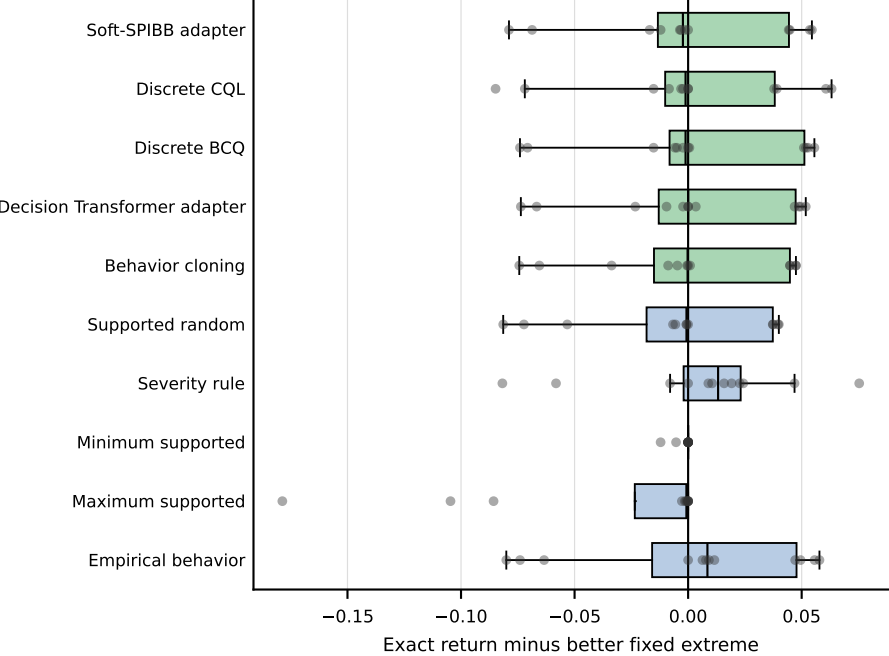

Task-balanced over respiratory, shock, and AKI; lower is better.

B Uncertainty: all probabilistic methods

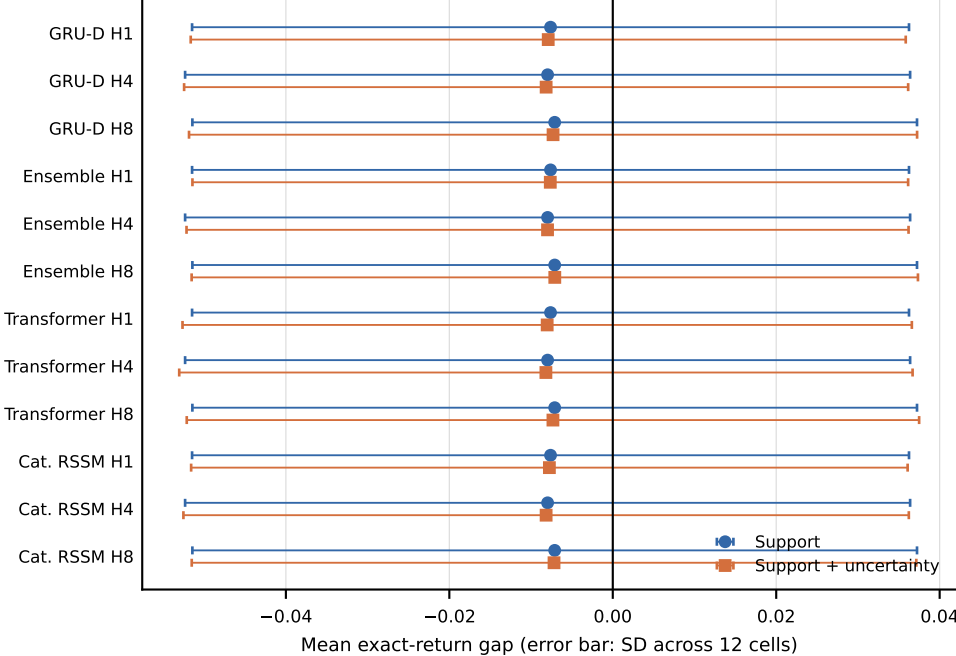

Same three cohorts; lower CRPS and calibration error (MACE) are better.

C Controls and model-free RL: every label

Twelve scale-qualified task-mechanism cells per label; box and points show all cells.

D Component model x planner: all 24 labels

H1: one-step exhaustive search. H4/H8: nominal 4/8-step categorical CEM, first action executed before replanning.
